Project1 Reflection

Before actual development, I've already had a complete set of design and have done a bunch of research of the target users, which is also my biggest motivation. So I am satisfied with the design and customization parts of this app. To make it more interactive, I found "Spring" library online to implement some animation.

Meanwhile, I didn't get enough time to deal with the data persistence part, which was the most difficult part of this app. Sharing data between different tab bars is not only about passing data but is about building a data model that could be accessed by different parts of the app. Also, for the plant growth part, it is also related to the data. The app should be able to do some calculation based on the data users type in.

It was really hard to imagine how much I learned in such a short period of time. I hope to utilize what I've learned in this class to do some research. I believe mobile is the trend of future and I really liked its combination of art and technology.
