*Changed Grad Project Idea

For the grad project, I decides to change it from an visualization app to a costume changing app with the aim having more exploration on how android fragment works and how it communicates with the interface.

In this app, I made two different layouts for phones and tablets. By clicking on the head, body and leg, user can generate his or her own character. On phones, there will only be a list of all the body fragments, while on tablets, there is a master-detail structure letting the user directly choose the part he wants from the left, and the result will be displayed on the right. On both platforms, the user would be able to click on each part of the body to change it instantly, which makes it more interesting.
